

EDiTH software update

Ladies and Gentlemen,

EDiTH software (all languages) has an update of the database file, which now includes information for Freightliner Airtronic D2 and Hydronic D5SC heaters mod. 25 2508 and 25 2509.

Please install the update right after installation of EDiTH or upgrade your existing installation. The update works only with EDiTH version S3V7-F. Earlier than S3V7-F versions of the software have to be replaced with S3V7-F in order to use updated database.

Updated database is available for download at www.espar.com/help (Diagnostic Software section) or directly in www.espar.com/tech_manuals/Diagnostic%20Software folder.

In order to install update, unpack zipped folder "EDiTH database update 03-2009.zip" (you may open the zipped folder and then just drag and drop its content onto desktop) and run included .bat file, which will copy the new database file into existing installation. Check message on the screen confirming that one file is copied and press any key to close the window. The files copied to desktop can now be deleted.

In case if updating using the batch file does not work, manually copy KD21Data.mdb into EDiTH folder (regularly C:\Program Files\EDiTH\) using instructions saved in the Diagnostic Software folder.

Run updated EDiTH and check if you have Airtronic heater mod 25 2508 Freightliner listed in Airtronic / Airtronic M / L section to make sure that the database is replaced correctly.

Please check updated "Computerized Diagnostic" document in Diagnostic Software folder for information regarding diagnostic adapter cable for High Altitude Kit (H-kit)
